The unit of length, the meter, was intended to be, and is very nearly, one ten-millionth part of the distance measured on a meridian from the equator to the pole, or 39.37 U. S. inches. Upon the meter are based the other primary units of measure: the *square meter*, the *cubic meter*, or *stere*, the *are* (100 square meters), the *liter* (the volume of a kilogram of distilled water at 4° C., equal to 1.000027 cubic decimeters), and the *gram* (the weight, very nearly, of distilled water at 4° C. contained in a cube whose edge is one hundredth of a meter). The Greek prefix *deca-*, or *deka-*, before a unit means ten; *hecto-*, one hundred; *kilo-*, one thousand; *myria-*, ten thousand; *mega-*, one million; thus, a *hectometer* is 100 meters. Similarly, the Latin prefix *centi-* before a unit means one tenth; *centi-*, one hundredth; *milli-*, one thousandth; and *micro-*, one millionth; thus, a *centigram* is one hundredth of a gram. See also **TABLES at MEASURE and WEIGHT**.

## TABLES OF MONETARY UNITS AND DENOMINATIONS

### WITH VALUES OF FOREIGN UNITS IN U. S. CURRENCY

**NOTE.** In the following tables the monetary units are indicated (in column two) by italic type and their par values in terms of United States currency are given (in column three). For many of the monetary units the par values have been determined by agreement between the particular countries concerned and the International Monetary Fund, established as an agency of the United Nations in July 1944; such values are indicated by an asterisk. These par values are not always the same as the actual exchange rates, which may change from day to day and which may vary considerably over a given period of time. For the current effective exchange value of any particular unit the daily newspapers should be consulted. By law the gold content of the U. S. dollar was fixed Jan. 31, 1934 at 15,238 grains of gold, or \$35.00 to a fine ounce; the British sovereign contains 113 grains. Because gold is held in reserve by the chief governments of the world, few gold coins have in recent years actually been minted or remain in circulation. Paper money and silver are most widely used for the higher denominations, aluminum-bronze and nickel for coins of smaller value, and bronze, copper, and alloys for the coins of lowest value.

# TABLE OF NUMBERS

**1. Cardinal numbers** are shown in the first three columns of the Table. First the names of the cardinal numbers are given; then the Arabic symbols (*Arabic numerals*) for them, as commonly used in arithmetic; next the Roman symbols (*Roman numerals*), used for dates, for introductory pages in books, upon the dials of timepieces, etc.; as in: the year MCMLIII (1953); page lxvi. The cardinal numbers are used in simple counting, or in answer to the question, "How many?" They give no information about the kind of things counted, or about the order in which they are counted, or about any relation they may have to each other.

The words for these numbers may be used as nouns (he counted *twelve*) or as adjectives (*twelve* boys). A number word is often used for a thing that is made up of the number of parts shown by the number word used, or that is marked with the figure or with the number of spots, marks, etc., shown by this word. Thus, a *seven* is sometimes used for a billiard ball with a 7 on it or for a playing card with seven spots, a *five* is used for a basketball team (which has five men), an *eight* for a racing crew in rowing, a *nine* for a baseball team, and so on.

**2. Ordinal numbers** are shown in the fourth and fifth columns of the Table. These names are formed usually by adding the suffix *-th* or *-oth* to the name of the corresponding cardinal number. The names of the ordinal numbers for 1 and 2, however, come from different words, and those for 3, 5, 8, 9, 12, 20, etc., have become more or less changed. The ordinal numbers are used (as adjectives or as nouns) to show the order or succession in which names, objects, periods of time, or the like,

are considered; as, the *twelfth* month; the *fourth* in a row of seats; the *18th* century.

**3. Fractions** (not shown in the Table). A fraction is one or more of the equal parts into which a unit, or an object or group of objects, may be divided. When written, a simple fraction consists of two numbers divided by a line ( $\frac{3}{4}$  or  $\frac{3}{4}$  or  $\frac{3}{4}$ ). The figure below the line (*denominator*) shows the total number of equal parts into which a unit is divided, the figure above the line (*numerator*) shows how many of these equal parts of the fraction are taken. Thus, the fraction  $\frac{3}{4}$  (read "three fourths") indicates 3 of the 4 equal parts into which the unit is divided. The number *one* is unity or a complete whole. The fraction of a complete whole divided into two equal parts is one *half* ( $\frac{1}{2}$ ); the names of the denominators of other fractions are the same as those of the corresponding ordinal numbers; as, one *third* ( $\frac{1}{3}$ ); one *fourth* ( $\frac{1}{4}$ ); seven *eighths* ( $\frac{7}{8}$ ) of the people present, a dime is one *tenth* ( $\frac{1}{10}$ ) of a dollar.

**4. Decimals or decimal fractions** (not shown in the Table). A decimal or decimal fraction is a proper fraction in which the denominator is some power of 10, usually not expressed, but signified by a point (*decimal point*) placed at the left of the numerator; as,  $2 = 2.0$ ,  $.25 = \frac{25}{100}$ ,  $.025 = \frac{25}{1000}$ . There are as many places to the right of the decimal point as there are ciphers in the denominator; as,  $\frac{25}{1000}$  is written .0088. The decimal .25 may also be expressed by the fraction  $\frac{1}{4}$  or by 25% (see PER CENT).

Examples: 1. What day of the week was Feb. 28, 1630? (1) 30 + 7; (2) 0; (3) 4; (4) 28 = 69. 69 ÷ 7 = 9 + 6.
